Healthcare Link Workshop

1/2-day Workshop
Language: English

Course Description

CDISC's Healthcare Link initiative has gone mainstream, with the original Retrieve Form for Data Capture (RFD) Integration Profile now incorporated the Structured Data Capture implementation guide from the Office of the National Coordinator of Health Information Technology. The basic functionality of RFD has been augmented by additional integration profiles, and hooked into HL7's successful strategy of standardized clinical documents called templated CDAs.

This half-day course will focus on the following:

- CDISC collaborative development with Integrating the Healthcare Enterprise (IHE) that resulted in Healthcare Link specifications that have been adopted by a number of Electronic Health Record vendors.
- How Healthcare Link address pre-population of electronic case report forms, and provides for creation and storage of eSource documents.
- The RFD (Retrieve Form for Data Capture), an IHE integration profile is in use now to support various EHR-research related use cases.
